

AN OVERVIEW OF

Columbia Active Risk Allocation Portfolios

Available at Morgan Stanley Wealth Management in the MAPS Program on the Select UMA Platform

AT A GLANCE

Investor goal
Managing volatility

Potential benefits

- Enhances diversification with a global approach**
 Provides multiple sources of return, including traditional and alternative investments, seeking to grow assets and mitigate portfolio volatility
- Manages risk to deliver more balance through a market cycle**
 Aims to improve investor outcomes and smooth the ride through volatile markets by diversifying risk
- Adapts to market conditions for more consistent returns**
 Uses tactical and strategic repositioning to dynamically adjust exposures as market conditions change

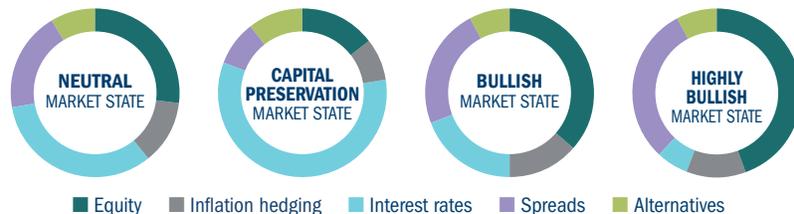

What do they do?

These model portfolios are built to pursue more consistent returns with a strategy designed to adjust risk exposure as market conditions change.

What makes them unique?

The portfolios follow a rules-based and systematic process that reallocates the portfolios on a monthly basis to align with current market conditions, helping the portfolio participate in market opportunities and seeking to mitigate risk during extreme conditions.

SAMPLE POSITIONING BY MARKET STATE

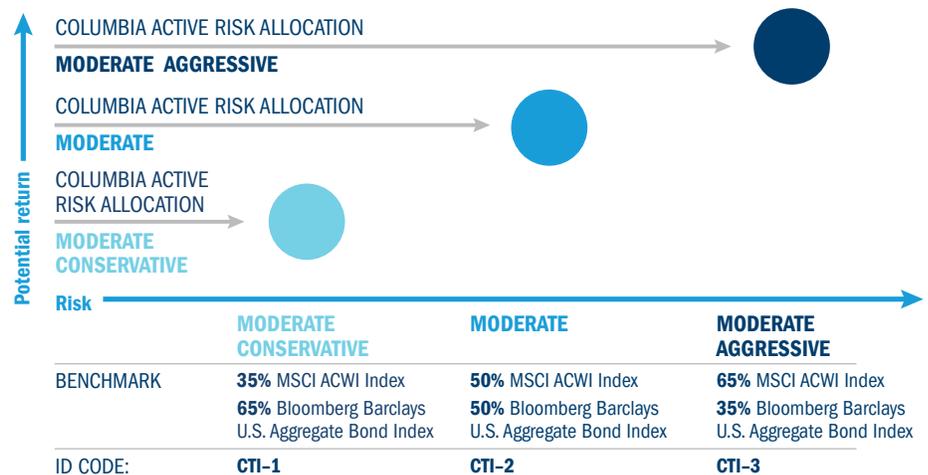

Sample positioning based on the moderate portfolio. Actual allocations subject to change.

How do they work?

These global, multi-manager, risk-allocated portfolios are constructed to adapt exposure to asset classes in traditional, nontraditional and alternative strategies. They adhere to a **rules-based market-state classification process**, adjusting risk exposure as market environments change to pursue consistent returns in all markets.

CHOOSE A PORTFOLIO THAT BEST ALIGNS WITH YOUR RISK TOLERANCE

The MSCI All Country World Index (MSCI ACWI Index) is a free float-adjusted market capitalization-weighted index that is designed to measure the equity market performance in the global developed and emerging markets. The Bloomberg U.S. Aggregate Bond Index is a market value-weighted index that tracks the daily price, coupon, paydowns, and total return performance of fixed-rate, publicly placed, dollar-denominated, and nonconvertible investment-grade debt issues with at least \$250 million par amount outstanding and with at least one year to final maturity. It is not possible to invest directly in an index.

There is no guarantee that the investment objective will be achieved or that return expectations will be met.

Backed by experts

Our **Global Asset Allocation team** harnesses deep expertise and firmwide resources to ensure we are creating and implementing strategies to help our clients reach their investment goals.

\$92 billion

Investment risks – **Market** risk may affect a single issuer, sector of the economy, industry or the market as a whole. The portfolios are subject to the investment performance (positive or negative), risks and expenses of **underlying funds** in which they invest. **Asset allocation** does not assure a profit or protect against loss. **Alternative investments** involve substantial risks and are more volatile than traditional investments, making them more suitable for investors with an above average tolerance for risk. ETFs trade like stocks, are subject to investment risk and will fluctuate in market value. Investment products, including shares of mutual funds, are not federally or FDIC-insured, are not deposits or obligations of, or guaranteed by any financial institution. Investing in **derivatives** is a specialized activity that involves special risks that subject the portfolio to significant loss potential, including when used as leverage, and may result in greater fluctuation in portfolio value. The portfolio's use of **leverage** allows for investment exposure in excess of net assets, thereby magnifying volatility of returns and risk of loss. **Commodity** investments may be affected by the overall market and industry- and commodity-specific factors and may be more volatile and less liquid than other investments. **Short** positions (where the underlying asset is not owned) can create unlimited risk. **International** investing involves certain risks and volatility due to potential political, economic or currency instabilities and different financial and accounting standards. Risks are enhanced for **emerging market** issuers. Fixed-income securities present **issuer default** risk. A rise in **interest rates** may result in a price decline of fixed-income instruments held by the portfolio, negatively impacting its performance and NAV. Falling rates may result in the portfolio investing in lower yielding debt instruments, lowering the portfolio's income and yield. These risks may be heightened for longer maturity and duration securities. Interest payments on **inflation-protected securities** may be more volatile than interest paid on ordinary bonds. In periods of deflation, these securities provide no income.

These managed account solutions are only available through investment professionals. Not all strategies may be available on all platforms. Managed account programs may require a minimum asset level and may not be appropriate for all investors.

Market state classification: The management team employs quantitative and fundamental methods to identify four distinct market environments, described as neutral, capital preservation, bullish and highly bullish. The market states are generally characterized by a combination of bond and stock market conditions as follows: capital preservation (unfavorable bond market and neutral stock market conditions), neutral (neutral bond and stock market conditions), bullish (neutral bond market and favorable stock market conditions) and highly bullish (unfavorable bond market and favorable stock market conditions). A strategic risk allocation is created for each environment by analyzing multiple market indicators such as interest rates, inflation measures, yield curve, momentum, volatility and valuations. The different allocations will include exposure to equity securities, inflation-hedging assets and fixed-income securities, consisting of rate assets (generally, fixed-income securities issued by governments) and spread assets (other fixed-income securities). The neutral market state represents the environment that the management team expects to be in the most frequently and under normal circumstances. In this state they intend to balance risk between equities and three other risk sources: interest rates, inflation-hedging and spread assets. Within the other market states, the management team may increase or decrease the risk exposure to certain asset classes with the goal of generating attractive risk-adjusted returns and minimizing drawdown in that environment. Allocations of risk to asset classes may differ significantly across market environments.
